

Introduction:

The Smart Ride Sharing System is a web-based platform developed to connect drivers and passengers traveling in the same direction for efficient ride sharing. The project allows drivers to post ride details and passengers to search and book available seats according to their travel requirements. The system includes features such as dynamic fare calculation, secure payment integration, ride booking, and user notifications for better convenience and transparency. This project helps reduce traffic congestion, minimize travel costs, and promote eco-friendly transportation through shared mobility solutions. Overall, the application provides a modern, user-friendly, and sustainable transportation management system.

System Architecture:

The Smart Ride Sharing System uses a layered architecture to manage ride posting, booking, payments, notifications, and reviews efficiently. It provides secure authentication using JWT, supports Stripe payment integration, and includes admin monitoring for smooth system management.

```

    WI[Web Interface (Web)] --> PL[Presentation Layer: Driver and Passenger (Signup/Login), Passenger Search & Book Rides, Passenger Gives Reviews & Ratings to Driver];
    PL --> AL[Authentication Layer: JWT Authentication, Admin Verification and Approval];
    AL --> AppL[Application Layer: Ride Posting Module by Driver, Dynamic Fare Calculation, Payment Processed by Passenger(Stripe), Notification System];
    AppL --> AdminL[Admin Management Layer: Monitor Users & Drivers, Manage Rides & Payments];
    AdminL --> DBL[Database Layer: User & Ride Details, Booking & Payment Records];
```

Methodology:

The Smart Ride Sharing System methodology focuses on developing a secure and user-friendly ride sharing platform. It enables drivers to post rides and passengers to search, match, and book rides efficiently. The system also includes payment processing, feedback management, and regular maintenance for smooth operation.

```

    A[Requirement Analysis & System Design: Identify user requirements and project objectives, Design UI/UX and database structure, Prepare workflow and system architecture] --> B[System Development & Security: Develop frontend and backend modules, Integrate APIs and database, Implement authentication and security features];
    B --> C[User Registration & Ride Creation: Drivers and passengers create accounts, Driver publishes ride details (Route, time, & seats), Ride data stored (MySQL Database)];
    C --> D[Ride Search, Matching & Booking: Passengers search available rides, System matches rides (location and timing), Booking request and confirmation process completed];
    D --> E[Payment, Feedback & Maintenance: Process payment after ride completion, Collect ratings and feedback from users, Perform system maintenance and future updates];
```

Conclusion:	Maps to:-	Name of Student	Name of Guide
The Smart Ride Sharing System was developed to create a reliable and user-friendly platform for connecting drivers and passengers traveling on similar routes. The project supports cost-effective and eco-friendly transportation by reducing traffic congestion and promoting shared mobility solutions. Overall, the internship project enhanced practical skills in Java Full Stack Development, modern web technologies, and real-time application development.	PO-1 to 3, PO-5 to 7 and PO-9 to 12.
